

Rangers Program – Cohort Size One-Pager

Why 6–8 Participants per Group?

Design Intent

- Deep practice, not just content.
- Realistic crisis-team feel.
- Strong individual coaching.
- High psychological safety.
- Operationally realistic in a high-load support org.

Group Size Options (Summary)

2–4 participants

- + Max airtime per person, very high trust.
- Too little diversity, simulations feel thin, many cohorts needed.

6–8 participants (Recommended)

- + Balance of airtime and diversity.
- + Mirrors the size of many effective small teams in high-stakes environments.
- + Everyone can lead, observe, and give feedback in each cycle.
- + Easier to build trust and track individual growth.
- Needs disciplined facilitation and good attendance.

10–15 participants

- + More people reached per run, more perspectives.
- Less airtime per person, easier to hide.
- Simulations become crowded; many observe instead of act.

>15 participants

- + Efficient for webinars / briefings only.
- Not suitable for intensive practice, feedback, or simulations.

Why 6–8 Works Best for Rangers

- Practice density: In 90 minutes, 6–8 people can each take turns leading in scenarios and simulations.
- Realistic team size: Small enough to coordinate quickly, large enough for different thinking styles and perspectives.
- Coaching depth: Facilitators can learn each individual's patterns and tailor feedback over 8 weeks.
- Safety and openness: Small enough that people are willing to expose weaknesses and experiment.
- Feasibility: Freeing 6–8 people for ~4–5 hours/week is demanding but realistic; 10–15 at that intensity is rarely sustainable.

Simple Decision Rule

- If the goal is awareness only → larger groups or broadcasts are fine.
- If the goal is real behavior change under pressure → default to 6–8 per cohort.
